## [AnonVPN - A MultiHopping, Unclassifiable VPN based on I2P](#)

AnonVPN is a different kind of VPN. It's an Open-Source, self-hosted, obfuscated VPN capable of multihopping using the censorship-resistant I2P network to make it nearly impossible for your ISP to determine that you are using a VPN and also provides additional protection from revealing information about yourself to a VPN Service.

For more information, visit [the details](#). For a picture of what is going on, visit the [diagrams](#). For information about running AnonVPN as a service, see [services](#)

For usage information, visit [the help](#).

## Downloads

The software is available from our [Github Releases](#) page.

### Latest:

This release is always built from the latest buildable code and may contain bugs.

- [Release Page](#)
- [Windows](#)
- [Debian](#)
- [Other Linux](#)

### Stable:

This release has undergone testing by the developers and is recommended for most users. It is always a copy of the most recent tagged release.
